Relational evidence: predicting status and deciding what to review

(a) Public records

Companies House
Registry records and director attributes

GLEIF
Legal-entity records and relationships

233,251 firms

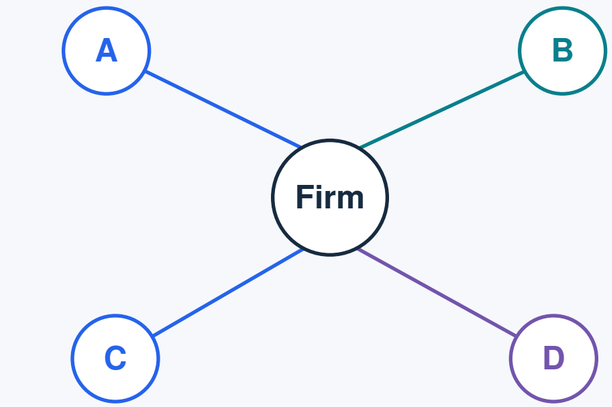

412,348 directed edges

Address-group split

Train / validation / test snapshots

Labels: contemporaneous registry status

(b) Corporate graph

Shared address

Registered ownership

Name-based association

A recorded link need not imply similar risk.

(c) Two distinct decisions

Predict corporate status
Rank firms by distress probability

Evaluate: average precision

Prioritize review
Rank predictions by need for scrutiny

Evaluate: retained error vs coverage

Research question:
Does conflict add error information?

Conceptual graph only. Dataset counts are observed; the additional value of conflict is the hypothesis under study.
